

Cubey 4 the solution?

A wheel on one of the six sides has to be turned to a specific point, and then pushed in one direction to move an inner panel enough distance to release the next panel.

When all six panels have been moved the correct distances, the top can be taken off.

This is not really a solution, since that depends on the positions of the wheels when the box was assembled.

Every wheel can be turned and moved at the start, but only one wheel can be moved the correct distance to start the opening sequence.

You will have to try by trial and error, which wheel will move the furthest.

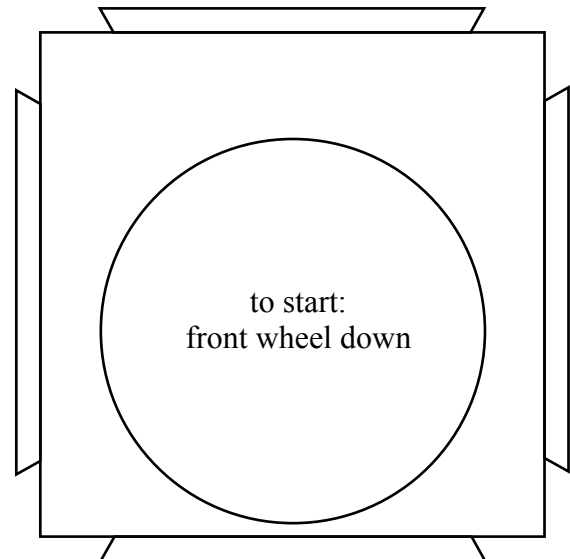

This will be the front panel.

Hold the box so that this panel faces you, and the sequence of opening is as follows:

Right panel forward.
Bottom panel to the right.
Back panel downwards.
Left panel to the back.
Top panel to the left, and lift off.
You will have to turn the wheels on those panels to the correct point to move those panels the right distance.

Homemade Puzzles

If you want to give yourself an advantage over other people trying to open this box, I suggest you put a secret mark on the front panel, so at least you know where to start!

Enjoy your puzzle
